

## Zoom Grip ZOE-DVL

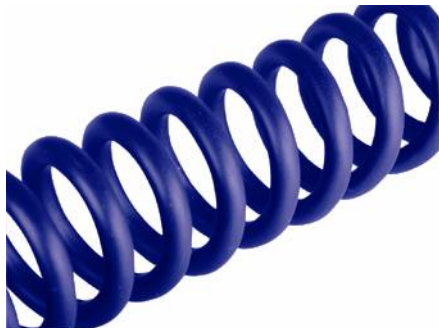

---

Like its predecessor the Zoe-dv-lanc the Zoe-dvl is a zoom grip for any SONY and CANON Camcorder with Lanc input socket. We considered the needs of our users during the whole design-phase and started to improve the new Zoe in numerous details. At the end no single part of the Zoe-dvl remained unchanged:

- The moulded elbow plug gives you two advantages. The cable goes along the camera, therefore looking better than being at a 90° Angle from the housing of the camera. If you pull the cable unintentionally, it will not bend the plug.

- The coiled cable has a total length of 90cm when it is pulled out, which is more than enough between pan arm and camera. If you pull the cable unintentionally, the coiled cable avoids damaging the plug into the camera.

- The shape of the housing protects the speed wheels and avoids accidental repositioning of the pre-adjustment.
- Despite of the additional new functions and thanks to the use of modern materials, the Zoe does not gain weight: It is, at **100 g**, as light as the previous version.

- MSR ® Maximum Speed Reduction. Thanks to this new function, you can limit the maximum speed of the zoom without losing the progressiveness of the rocker switch. It makes it even easier to get slow, smooth and stable zoomdrives.

- The On/Off Knob controls remotely the main switch of the camera. A green LED informs the user if the camera is switched on or off.
- The “Record” knob in the middle of Zoe controls remotely the Record function of the camera. When the camera is recording, the red LED is lit (only dvi). This knob is bigger than the other two, allowing the user to recognise it with finger tips.
- The Focus functions are the same as on the previous version of Zoe: a double click switches the camera between manual and auto-focus. A single click switches the rocker switch between Zoom and Focus. A longer click activates the Push-Auto function.

- The new clamp goes on any tripod arm or tube up to 34mm of diameter. It is made with bigger screws than the previous version, so that it has become much quicker to close or to open.

- The special shape of the rocker switch allows you to put your thumb at three different places: middle, right or left. In any situation, you will find a position for your finger where you can use the Zoe in a precise but comfortable way.

Zoe-dvl is available for:

- any Sony or Canon camera with a LANC input socket.
